Pediatric stroke can happen in infants, children and even before birth.

STROKES CAN HAPPEN AT ANY AGE

PERINATAL STROKE
Last few months of pregnancy to 1-month-old

The cause in most perinatal strokes remains unknown.

Risk factors that could lead to stroke include:
- Congenital heart disease
- Diseases affecting the brain’s arteries
- Infections affecting the brain or other organs

Signs of a perinatal stroke may go unrecognized for months or years because the signs can be subtle.

NEWBORNS:
Seizures may be an early sign:
- Repetitive twitching of face, arm or leg
- Apnea (pauses in breathing) associated with staring

DEVELOPING CHILDREN:
- Decreased movement or weakness on one side of the body
- Showing a hand preference, or consistently reaching out with only one hand before 1 year of age

CHILDHOOD STROKE
1-month-old to 18 years

Risk factors in children ≠ Risk factors in older adults

Risk factors for children include:
- Congenital heart disease
- Diseases affecting the brain’s arteries
- Infections affecting the brain or other organs

Risk factors that could lead to stroke include:
- Head trauma
- Sickle cell disease
- Autoimmune disorders

No previous risk factor is identified in about half of childhood stroke cases.

WARNING SIGNS

Signs are often missed in children because there is a lack of awareness that strokes can happen in this age group.

STROKE SIGNS

ADDITIONAL SIGNS IN CHILDREN INCLUDE:
- Severe sudden headache, especially with vomiting and sleepiness
- Weakness or numbness on one side of the body difficulty speaking or understanding others
- Vision loss or double vision
- Severe dizziness or loss of coordination
- New-onset of seizures usually on one side of the body

TIME IS BRAIN AT ANY AGE

NEWBORNS:
Quick recognition ➔ Prompt medical evaluation and treatment

BABIES:
Early diagnosis ➔ Rehabilitation treatment can start while a young brain is still developing

DON’T DELAY!

Prompt diagnosis and treatment of stroke in children is as critical as it is in adults.
